## How to Emule in High ID ?

After installing the VPN you can log onto multiple VPN

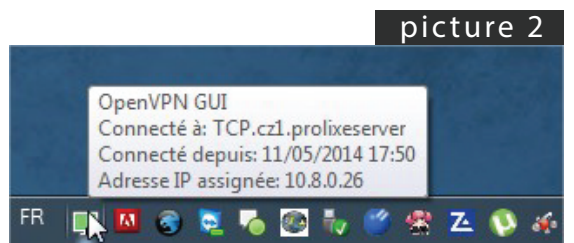

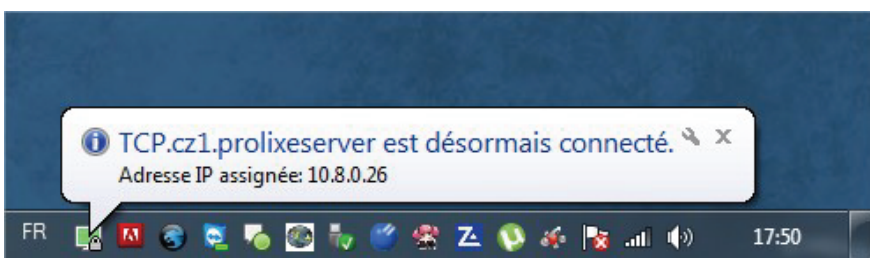

Start OpenVPN that it starts in the taskbar at the bottom right of your desktop, right-click on it and log on to one of three modes TCP ( UDP mode does not work to be High ID ).

Exemple: [TCP.cz1.prolixeserver](#)

Enter your Username and Password in the window that appears and confirm.

After a few seconds OpenVPN connects to the server and the icon turns green and a message appears with your information private IP to the server. Remember the last digit (below 26).  
You can know your private IP by putting your mouse cursor on OpenVPN in the taskbar. See picture 2.

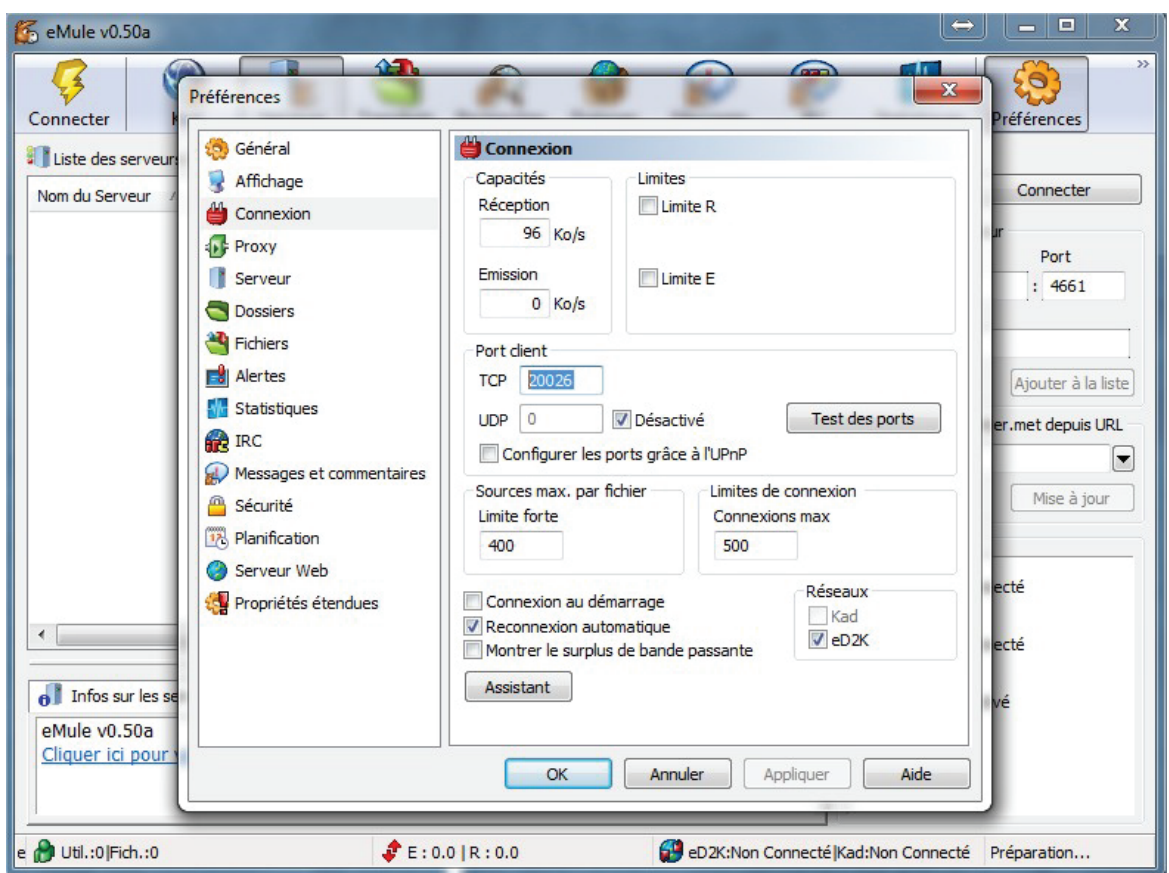

Now launch Emule and go to "Settings" and then "Connect" menu

In TCP you need to port 200 + IP or 20 + IP.

That is if your IP ended : x you need to port 200x  
xx you need to port 200xx  
xxx you need to port 20xxx

So to continue our example, I have put 20026 in TCP.

And finally disable UDP, if you do not have to do a "test ports".

**Do not forget to allow your firewall (if you have one) to run OpenVPN on your network.  
Also check that the date and time of your PC are correct.**

**For holders of a PAYPAL account**

WARNING, Paypal checks your IP every time you connect. To avoid getting restrict your account, do not log in to your Paypal account with a different IP too often.
